

Write a Python program that takes a student's marks in three subjects as input.

- If the average is greater than or equal to 90, print "Grade: A".
- If the average is between 80 and 89, print "Grade: B".
- If the average is between 70 and 79, print "Grade: C".
- Otherwise, print "Grade: Fail"

The screenshot shows a Google Colab notebook interface. The code cell contains a Python program that takes marks for three subjects as input, calculates the average, and prints the corresponding grade. The output shows the user entering marks for Subject 1 (45), Subject 2 (98), and Subject 3 (34), resulting in a grade of 'Fail'.

```
a = float(input("Enter marks for Subject 1: "))
b = float(input("Enter marks for Subject 2: "))
c = float(input("Enter marks for Subject 3: "))

avg = (a + b + c) / 3

if avg >= 90:
    result = "A"
elif 80 <= avg < 90:
    result = "B"
elif 70 <= avg < 80:
    result = "C"
else:
    result = "Fail"

print(f"Grade: {result}")
```

Enter marks for Subject 1: 45  
Enter marks for Subject 2: 98  
Enter marks for Subject 3: 34  
Grade: Fail
